AIR DRY CLAYS SELF-HARDENING

Marblex, and its Terra Cotta counterpart Mexican Pottery clay, are moist and ready to use for anything from sculpting to wheelthrowing. Knead them to increase their plasticity before use. Allow your finished pieces to dry slowly and evenly on all sides at room temperature, and away from heat, until hard. When completely dry, finished pieces are durable - but NOT waterproof. After decorating, it's a good idea to coat them with a shellac or varnish to seal it and make your piece water-resistant.

- DO NOT FIRE & NEVER USE FOR FUNCTIONAL WARE -

NSP (Sulfur Free)

NSP is a sulfur-free, somewhat stiffer, waxier, sculpting Plasteline often used for product prototypes. It works well with most molding materials. It can be melted and poured at approximately 185° F. To melt and pour, do not use direct flame. You can place on a burner at a very low temperature or use a double boiler for best results. Once molten, brush onto cores to quickly build up to desired thickness.
